

EMERALD POWER INC.

Battery Recycling Program

Emerald Power's Uninterruptible Power Supply (UPS) battery recycling services include: de-installation, rigging, removal, logistics, transportation, storage, and recycling—everything you need to make your UPS Battery supply removal project run as smoothly as possible. Battery recycling is done through one of three smelting facilities we use, where 98% of the battery is reused (100% of the lead) and repurposed for future battery manufacturing. Upon unloading of the batteries to these facilities; Emerald Power is given paperwork to document the transfer of ownership to the recycling facility, which we will provide to you (the customer). Our turnkey UPS Battery Recycling Service is specifically designed to help your company protect the environment and remain in compliance with environmental laws. That's because we can handle the whole process for you.

Emerald Power agrees to defend, indemnify, and hold harmless said customers, its parent, subsidiaries, and affiliated companies (if applicable) and as to each of those parties, their respective shareholders, officers, directors, principals, agents and employees against any and all losses, liabilities, damages, injuries, claims, demands, causes of action, costs and expenses arising out of Emerald Power transportation of waste batteries obtained from customer sites.

Emerald Power is dedicated to reducing carbon footprint and helping customers maximize their power while reducing their cost and liability. Efficient Power Products for a "greener future" and this includes the removal of old equipment, batteries and electrical infrastructure.

Emerald Power; for a "Greener Future!"
